A literature survey including electrical properties of tissues relevant to low frequency calculations has been compiled and included in one chapter. A novel improved bem approach is introduced in order to solve this type of problems leading to more accurate results and more efficient calculations. The developed methodology is applied to three different case studies: i overhead power transmission lines ii power substation rooms and iii pregnant woman including foetus and evolving scenarios. In all the cases a sensitivity analysis investigating the influence of varying geometrical and electrical properties of the tissues has been conducted.
